

Multi-Conductor Single Turn Lead Retainer

The PRJ Equipment Company Lead Retainer has been designed so that it is easily and quickly interchangeable with the knuckle holder on our James Design Coil Spreaders Model 75 and smaller.

It was designed to assist in the spreading of lap wound, single turn, multi-conductor armature coils. Coils are loaded and spread in the same manner as are stator coils. To install the Lead Retainer simply remove the two (2) bolts in the knuckle holder retaining plate. This allows the standard knuckle holder to be removed and the Lead Retainer to be installed.

Due to our quick-acting mechanical toggle clamps, there is no need for an external air supply or hydraulic pressure for clamping the coil.

The PRJ Equipment Company Lead Retainer comes complete with three (3) sets of twelve (12) each interchangeable spacers in 1/8", 3/16" and 1/4" thickness. This insures maximum versatility from top to bottom.

NOTE: When ordering, specify the end of the spreader that the Lead Retainer is to be used on.
